

## Using Avolites Authenticator Application To Licence An Ai System.

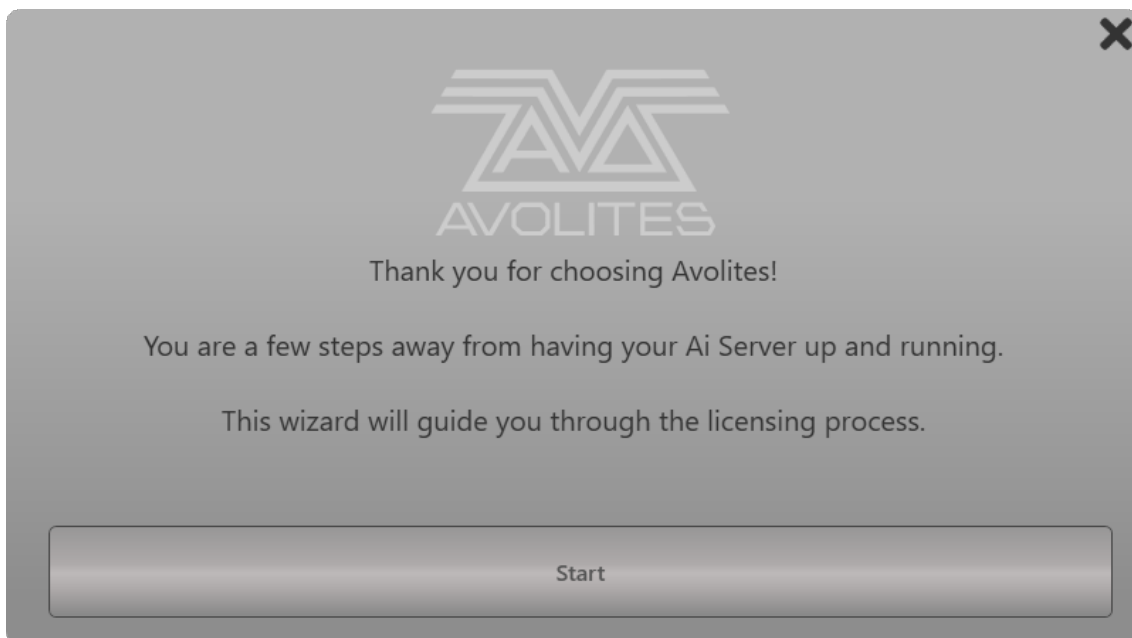

From version 11 and onwards, Ai will make use of the new Avo Key security system. This initially requires authentication of the licence key for it to be used. All new media servers from Avolites will feature an internally mounted dongle.

You will need:

- A device with an Internet connection for authentication
- A removable drive to transfer tokens between the internet machine and the server

The process to authorise your new Avo Key for an Ai server is as follows:

1. First, locate the Authenticator application which can be found in C:\Avolites\Ai\Distrib\System\Avolites Authenticator
2. Double click Authenticator.exe to run the application
3. On the first pop up window, press Start

4. In the Serial Entry window, select the model of server from the drop down on the left and enter the serial number in the right and then press confirm.

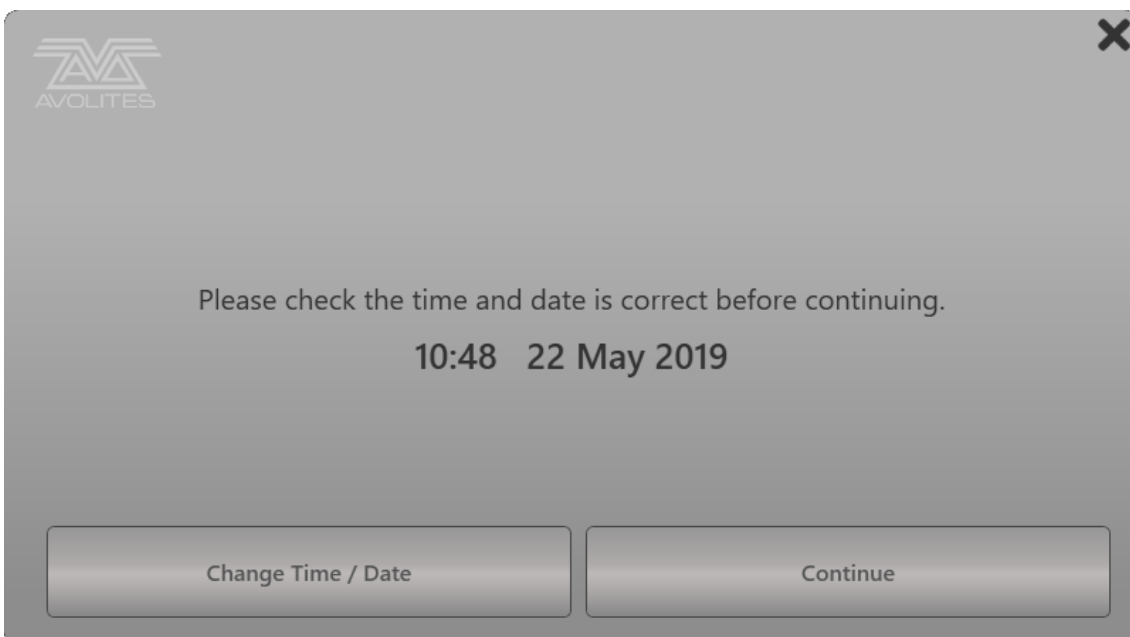

AVOLITES

Please enter the serial number of your server.

For example: AiS-00000

Confirm

5. On the date window, check that the displayed time and date is correct. If they are not correct, press the Change Time/Date button and adjust accordingly. Once set to the correct Time And Date, press Continue.

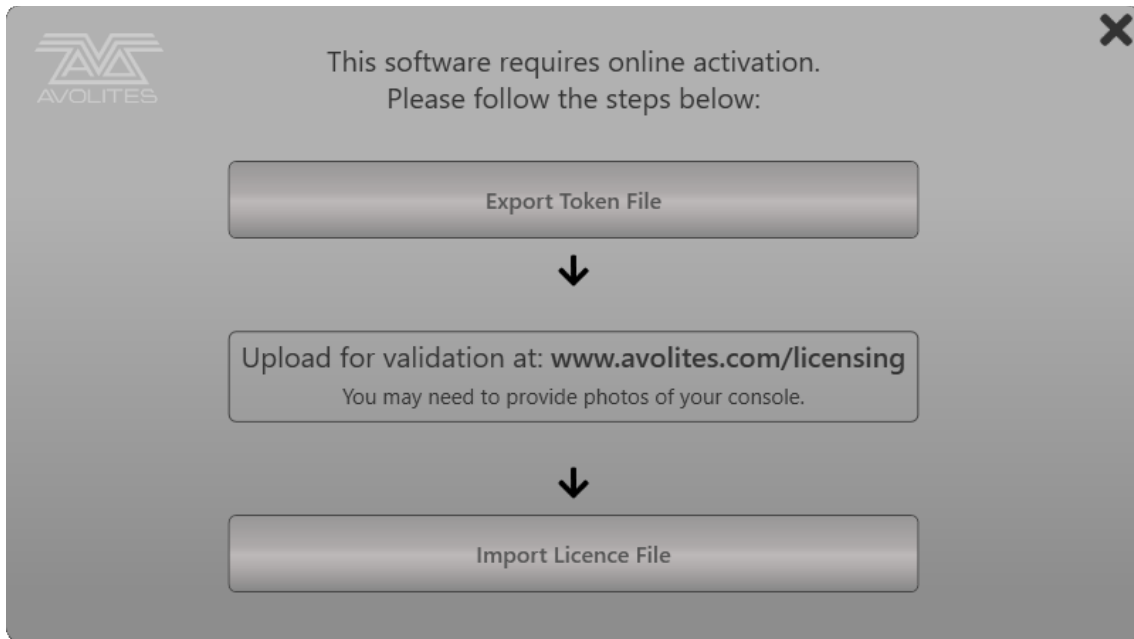

AVOLITES

Please check the time and date is correct before continuing.

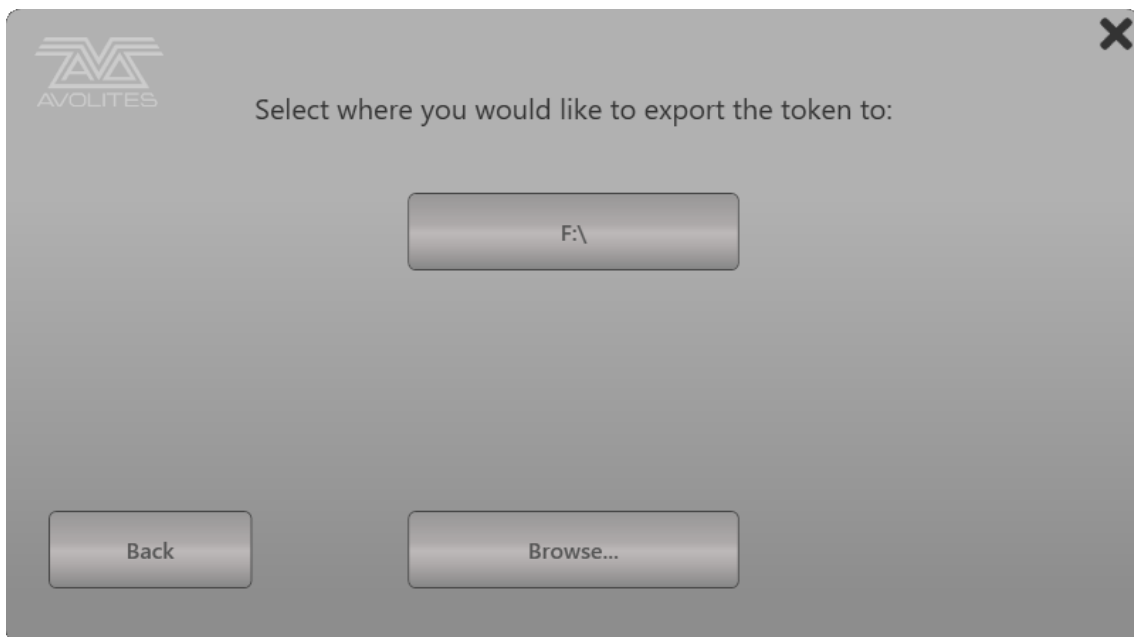

10:48 22 May 2019

Change Time / Date Continue

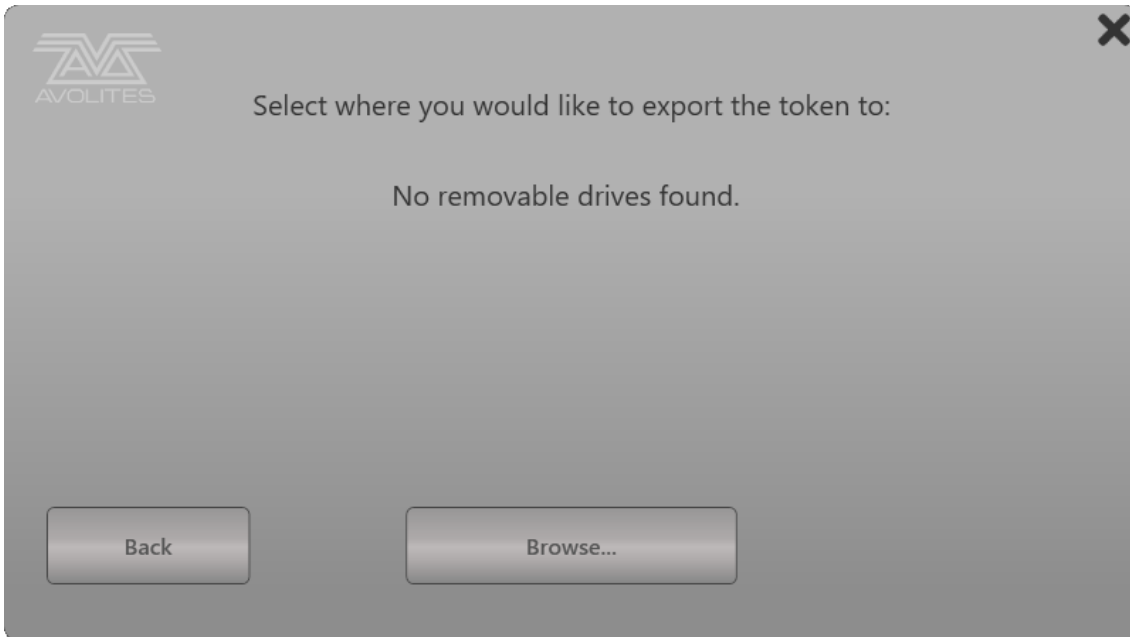

6. To save the token so that it can be entered into the authentication system, press the Export Token button.

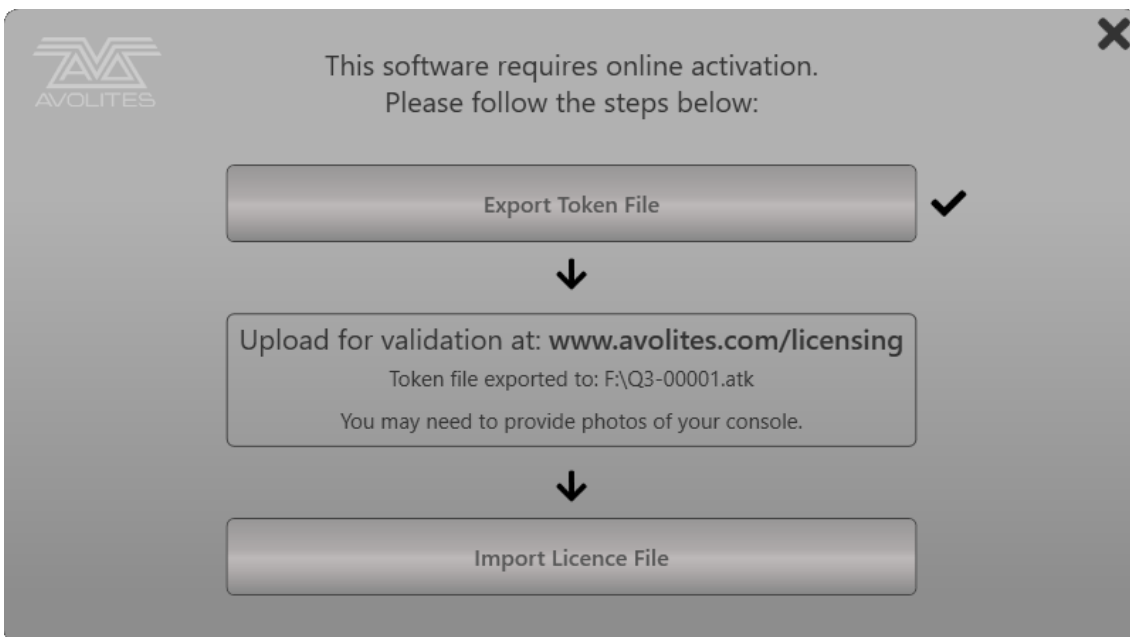

7. If a removable drive is already plugged into the system, it will show as a destination and can be selected.

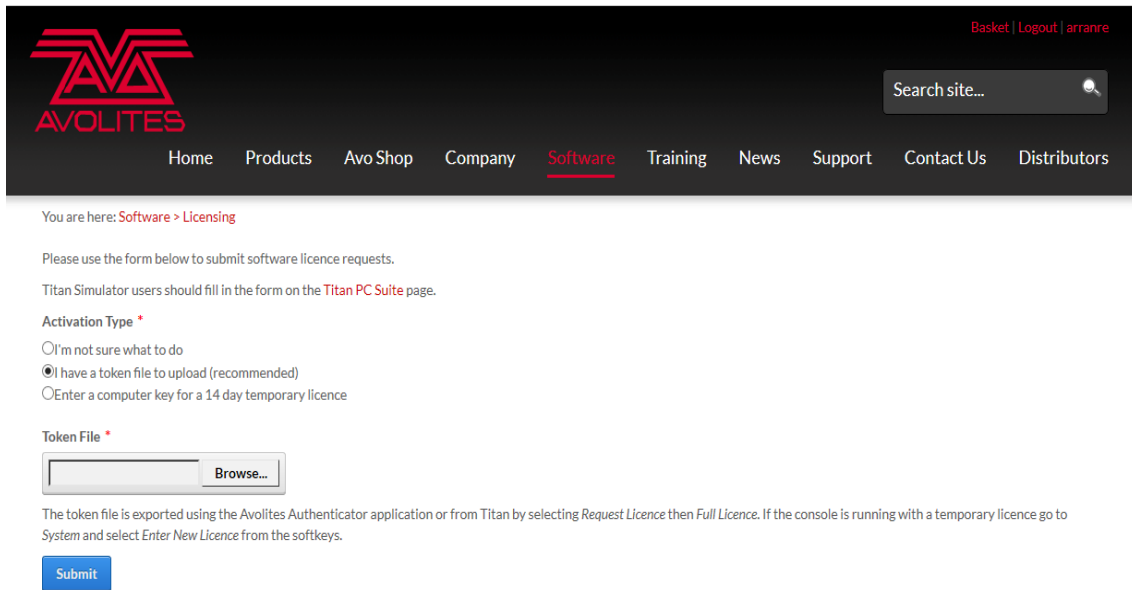

- If no removable drive is currently available, press the Back button, insert a removable drive and then press the Export Token File button again. Alternatively, the Token File can be saved elsewhere on the system using the browse button.

- Now, back on the Export Token window, enter the web address shown into a browser

10. Follow the on screen instructions, upload the token file and provide any information or proof of ownership that is required and submit the application

The screenshot shows the Avolites website's software licensing page. At the top left is the Avolites logo. To the right, there are links for 'Basket', 'Logout', and 'arrange'. Below the logo is a navigation menu with links for 'Home', 'Products', 'Avo Shop', 'Company', 'Software' (which is underlined and highlighted in red), 'Training', 'News', 'Support', 'Contact Us', and 'Distributors'. A search bar is located to the right of the navigation menu. Below the navigation menu, the breadcrumb trail reads 'You are here: Software > Licensing'. The main content area contains the following text: 'Please use the form below to submit software licence requests. Titan Simulator users should fill in the form on the Titan PC Suite page.' Under the heading 'Activation Type \*', there are three radio button options: 'I'm not sure what to do', 'I have a token file to upload (recommended)' (which is selected), and 'Enter a computer key for a 14 day temporary licence'. Below this is the 'Token File \*' section, which includes a file input field with a 'Browse...' button. A note below the input field states: 'The token file is exported using the Avolites Authenticator application or from Titan by selecting Request Licence then Full Licence. If the console is running with a temporary licence go to System and select Enter New Licence from the softkeys.' At the bottom of the form is a blue 'Submit' button.

11. When the licence has been processed and issued, you will receive an email to the address registered with your Avolites account with a Licence File attached. Please allow up to 72 hours for this process to be completed, however most licences are issued on the same day as the application is submitted.
12. Now that you have received the token, download it to the removable drive and plug it into the server. In the Token File window, press Import Licence File and locate the token file. To apply it to the system.
13. When the licence file has uploaded correctly, you will see a confirmation screen. This licence is now stored on the Avokey itself and will not need to be reapplied for if the machine is reformatted.
